BarBuddy progress report

Prepared October 21, 2026 from a review of the BarBuddy code against the capstone paper

BarBuddy is **63%** complete. The features are **80%** built, but deployment is **23%** done, so nothing is live yet. The quickest gains are deploying and running the paper's test plan.

Overall	Features (objectives and scope)	Deployment (Lambda, website, DNS)	Testing and QA
63%	80%	23%	30%
63.4 of 100 points	55.8 of 70 points	4.6 of 20 points	3.0 of 10 points

Where the points are

Each segment is one area, sized by its weight. The filled part is what is done.

Features 55.8 / 70 **Deployment** 4.6 / 20 **Testing** 3.0 / 10

Features against the paper

The paper's four specific objectives and eleven scope items, grouped into nine modules.

Module	In the paper	Weight	Done	What's missing
Essay answering	Scope 5	8	92%	Nothing major. Reading timer, countdown, auto-save, auto-submit and history all work.
AI feedback and lawyer verification	Objective 2, Scope 6	10	90%	Gemini scoring with ALAC and the 5-point scale, plus Unverified to Verified, all work. Breaks on Lambda until the AI runs outside the request.
Syllabus, questions and resources	Scope 4	7	90%	Create, edit, archive, CSV import and duplicate checks work. An unused Create Subject Exam form is still in the code.
Engagement	Objective 4, Scope 9	7	88%	XP, levels, streaks, badges, milestones, mastery points, challenges and badge management work.
Login and role-based access	Scope 2	8	88%	Pages have no login or role check in the browser; only the backend checks roles. Supabase Auth replaces the Cognito named in the paper.
Dashboards and reports	Objective 1, Scope 3	8	72%	Super Admin Payment Management shows dummy data. AI config Apply, System Preferences and the maintenance stop are not wired.
Subscription and payment	Scope 2, TC-SUBS	8	70%	No promo codes (TC-SUBS-007 and 008). QR Ph is not turned on. The webhook is not registered and no full test payment has been run.
Competency, readiness and recommendations	Objective 3, Scope 7 and 8	10	70%	The Hesitation/Fluency, Reading and Writing score formulas (Figures 3.16 to 3.18) are not in the code. Nothing references Bloom's taxonomy.

Module	In the paper	Weight	Done	What's missing
Settings and account extras	Settings pages	4	40%	Notifications, two-factor, sessions, Contact Support, Report a Problem, font size and topbar search do not save.

Deployment

The paper's stack: AWS Lambda behind API Gateway, a hosted React site, and a public domain.

Item	Weight	Done	Status
Lambda backend	6	40%	Handler and bundle are written (API, 7:00 AM rollout, payment expiry). Not deployed: no API Gateway, infrastructure config, environment variables or EventBridge rules.
Website hosting	5	10%	The production build works. No hosting is set up (Amplify, S3 with CloudFront, or similar).
Domain, DNS and HTTPS	4	0%	No domain is registered or configured.
Production settings	3	15%	Supabase sign-in redirect URLs, the API's allowed origin, PayMongo live keys and the live webhook are still to do.
Email	2	60%	Gmail SMTP works. The paper names AWS SES.

Two code changes before Lambda

- **AI feedback.** Gemini scoring runs in the background after the submit response is sent. Lambda freezes once it responds, so the feedback would usually never finish. Run it from a queue or a second function, or wait for it.
- **Syllabus uploads.** PDFs are sent through the API, and Lambda rejects request bodies over about 6 MB. Upload large files straight to Supabase Storage instead.

Buttons and forms that don't work yet

Only controls a user can reach. Two forms that no page uses are left out.

13 open the Coming Soon page 8 look like they save, but don't

Biggest gains

Estimated points each step adds to the overall score.

Deploy the backend to Lambda (with the two fixes), host the website, and set up a domain, DNS and HTTPS

 +15 points

Run the paper's test cases and the User Acceptance Testing

 +7 points

Put real payments on Payment Management and wire its buttons

 +3 points

Add the Hesitation/Fluency, Reading and Writing scores and Bloom's tagging, or narrow the paper's scope

 +3 points

Add promo codes and turn on QR Ph

 +2 points

Done together, these would bring BarBuddy to about **93%**.

How this was scored

The code in the BarBuddy repository was checked against the capstone paper: its specific objectives, scope and limitations, functional requirements and test-case list. Each item gets a weight and a completion estimate. An area's completion is the weighted average of its items, and the overall score adds up weight times completion. The weights and estimates are judgment calls from that review, not test results.
